

0- Make sure you have git installed locally

1- Start Android Studio

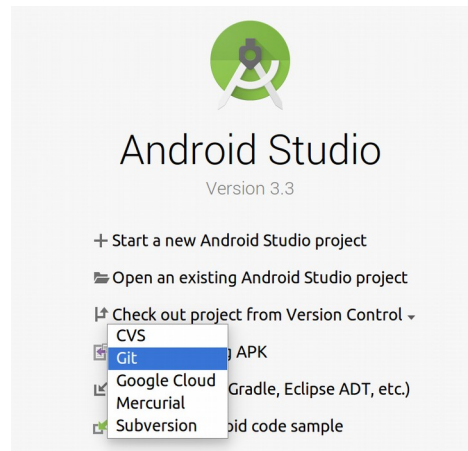

If you had a project open, close it.  
files/close-project.

2- Select

“Checkout project from version control”

3- Select Git

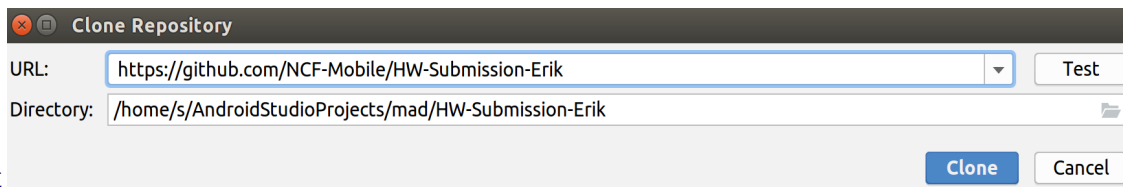

4- Enter the url of your repo as below

This will  
clone the  
repo

(<https://github.com/NCF-Mobile/HW-Submission-Erik>

<https://github.com/NCF-Mobile/HW-Submission-yourfirstname>) for you locally.

5- Modify Q1 and Q2 codes in the android project (they just have empty activities)

6- **Check-in** and **push** your changes back to your same repo. Each of you has a repo with the name HW-Submission-X (where X is your first name).

7- If you have **github questions** post them online, help each other directly (for github it is ok), or consult Ozan (your TA). You can also find a tutorial on integrating github with Android Studio but you can always open a terminal from within android studio and issue git command lines.

8- You may not help each other directly with coding. You can post coding question on Canvas though and answer with some general hints or I or your TA will answer them as we see fit.
